How it works

The bug

- When repositioning and/or changing the frame of the subview displayed on top of the blur, the close button doesn't move along with it.

My solution

- 2) Add new public method
 - (void) moveCloseButton:(CGPoint)point
changes the position of the close button in order to have it in the top left corner

Pros and cons

- `moveCloseButton`
- + fast and easy to use when implementing complex animations
- + more appropriate for some specific subviews
- - not obvious until searched for in the documentation

Result

- Wrote mail to Ryan, but never heard of him
- Last activity on his account in March
- Waiting in line for pull request
