I guess those games would only be usable from Kopete, right?
I wouldn't use it and when they are only compatible with Kopete, you
need KDE software anyway and then people could also play more advanced
version from the KDE Games module. ;)
IMO polishing the features Kopete already has, is more important.

I don't think discouraging new ideas is any good, and mostly in Kopete where the
development is quite stalled.
Moreover I think that such plugin could lead to some functionality that we all wanted KDE to
have at some point (remote p2p gaming) but we never achieved because of waiting for some
new technologies to appear (read Decibel for KDE) that never would and alternatives are not
still there yet.

Cheers!
Aleix

will export contacts with some informations, like numbers, or mails to text
file. It should by realized like a checkbox in export form. After marking
the checkbox, the contacts would be exported into text file, otherwise into
the KAddressbook. This text file could be also imported, for example in the
case of loosing account. Do you think that it would by useful and I should
write this, or not?

I would LOVE it :)

Sure, I think it would be useful. Please submit a patch.
