My work – solution

- About 1 day to understand how this project work and about 5 hours of implementing
- Created regex for parsing specific part of webpage
- Added new column to DB
- Created new line on screen with clickable text (open web browser)
- This solution wasn't accepted

My experiences

- First contact was quick and friendly
 - After first commit great reaction, what is wrong and what should be done better
- ...
- but then disagreements between developers, what should be best solution

Proposed solutions

■ About View

- „Link: <http://www.domain.com/longtext...>“
- „Link: ... *domain.com/longtextABCdef* ...“ – rolling text on line

■ About DB

- no new column for new attribute, but add link to other column at the end and then split... (this seems to me the most strange)

■ Final result:

- wasn't selected any solution, my solution was refused
