Description of my work

- Fix improper placement of html 5 audio control bar

- Bug in CSS

- Originally, I had a different bug caused by Mesa library

- But newest Mesa did not cause the bug → resolved

Result of my work

- All elements inside audio tag had height 28px

- But audio itself appeared as if it had height 25px

- So the content overflowed

- There was no definition of audio height in CSS

- So I only had to set the height of audio element

  audio { min-height: 28px; }

- Currently the fix is sent and I'm waiting for someone to test it

Project, community

- Firefox is extremely large

- >250k files, >1000 CSS files

- Hard to figure out what is where

- A lot of documentation, but there is no simple guide explaining what is in which folder

- People are trying to help

- A lot of active people on irc
